1 Johdanto

Rajakiiri Oy suunnittelee Raahan edustan merialueelle sijoittuvaa merituulivoima-aluetta. Alueesta on tehty varaussopimus Metsähallituksen kanssa. Tässä raportissa esitetyt tulokset liittyvät hankkeen ympäristötutkimusten ja rakentamissuunnitelmien päivitykseen ja luovat taustamateriaalia hankkeen teknistä suunnittelua varten. Hankeen YVA on tehty 2009–2011 ja voimassa olevat osayleiskaavat hyväksytyt 2013. Alueen osayleiskaavat päivitetään tässä yhteydessä, koska alueelle suunniteltavien voimaloiden koko on kasvanut ja sijoittelu muuttunut. Raportissa esitetään suunnittelualueen sedimenttinäytteenoton tulokset avovesikaudella 2024 kerättyjen näytteiden perusteella.

2 Alueella tehtyt toimenpiteet

Maanahkaisen tuulivoima-alueen suunnittelualueella suoritettiin elokuussa 2024 sedimenttinäytteenottoa (Kuva 1). Suunnittelualueelta otettiin sedimenttinäytteitä kaikkiaan kymmenestä paikasta. Näytteenotto kohdistettiin GTK:lta saadun pohjanlaatuaineiston perusteella suunnittelualueella oleviin pehmeisiin pohjiin (ks. Liitekartta raportin lopussa). Näytteenoton suoritti Luode Consulting Oy:n henkilöstö. Työ tehtiin kahdessa osassa siten, että alueelta otettiin erikseen erillisiä näytteitä pintasedimentistä, minkä lisäksi syvempien kerrosten yleistä pilaantuneisuutta selvitettiin koko suunnittelualueelta kerättyjen kokoomanäytteiden avulla. Kokoomanäytteet muodostettiin samoilta pisteiltä kerätyistä näytteistä kuin erillisiä näytteitä.

Kuva 1. Maanahkaisen Suunnittelualue ja vuoden 2024 sedimenttinäytepisteet.

3 Sedimenttinäytteenotto ja normalisointi

Sedimenttinäytteenoton tarkoituksena oli selvittää sedimenttien laatua, haitta-ainepitoisuuksia ja läjityskelpoisuutta tulevia vesistötöitä varten. Erillisiä näytteitä pintasedimenteistä otettiin alueen sedimenttien kovuudesta johtuen Van Veen - tyyppisellä kahmarinäytteenottimella.

Kokoomanäytteet otettiin Piston corer -tyyppisellä putkinäytteenottimella, mikä pehmeissä paikoissa mahdollisti näytteiden saannin parhaimmillaan aina 100 cm tavoitesyvyydelle saakka. Alueen pehmeämmät sedimentit löytyvät suunnittelualueen itäreunalta.

Työohjelman mukaan metallipitoisuudet analysoitiin ylimmän 0-10 cm kerroksen erillisiä näytteistä. Näytteistä analysoitiin metallit ja kokonaisrikki. Erillisiä näytteitä ei normalisoitu.

Muita haitta-aineita sekä sedimentin fysikaalisia ominaisuuksia analysoitiin kerroksittain kokoomanäytteestä. Kokoomanäyte muodostettiin 30 cm kerroksista ja

samaan näytteeseen yhdistettiin kaikkiaan kymmenen näytepisteen sedimentit. Analysoitavaksi toimitetut näytekерrokset olivat 0–30 cm, 30–60 cm ja 60–100 cm. Näytepisteet olivat samat kuin erillisnäytteiden pisteet. Alueen sedimentit olivat pääosin hiekkaisia, minkä johdosta yli 30 cm kerroksia saatiin kerättyä vain kolmelta paikalta. Alimman analysoitavan näytekерroksen paksuus määräytyy sedimentin pehmeiden mukaan, alle 5 cm paksuisia näytteitä ei otettu mukaan niiden huonon edustavuuden takia.

Tutkimusohjelman mukaisesti kokoomanäytteistä määritettiin seuraavat analyysit:

- savipitoisuus ja raekokojakauma aerometrisesti/seulomalla määritettynä
- kuiva-ainepitoisuus ja hehkutushäviö
- vesipitoisuus ja irtotiheys
- metallit ja kokonaisriikki (typpihappouutto)
- orgaaniset tinayhdisteet (tributyyli- ja trifenyylitina)
- PCB-yhdisteet (kongeneerit 28, 52, 101, 118, 138, 153, 180)
- PAH-yhdisteet
- öljyhiilivedyt C10–C40
- PCDD–PCDF–PCB
- kokonaisfosfori ja -typpi
- TOC

Raportin lopun liitteistä löytyvät yksityiskohtaisemmat tiedot käytetyistä menetelmistä, laboratorioista sekä tutkimustodistukset.

3.1 Aistinvaraiset havainnot

Sedimenttinäytteet analysoitiin aistinvaraisesti hajun ja värin osalta heti näytteenottohetkellä (Taulukko 1a ja 1b). Hajun perusteella voidaan arvioida pohjan happiolosuhteita hapettomissa olosuhteissa esiintyvän rikkivedyn avulla. Valokuvat näytteistä on esitetty taulukossa 2. Erillisnäytteiden pintakerros oli hapekas, mikä näkyy hyvin myös kuvissa. Osassa näytteissä esiintyi silti rikkivedyn hajua.

4. Tulokset ja johtopäätökset

Taulukossa 3. on esitetty erillisnäytteistä analysoidut laboratoriotulokset. Erillisnäytteitä ei tutkimusohjelman mukaisesti normalisoitu vaan niistä määritettiin vain metalli- ja rikkipitoisuudet.

Kokoomanäytteiden normalisoidut pitoisuudet on esitetty liitetaulukoissa raportin lopussa. Normalisoinnilla tarkoitetaan analyysituloksien muuttamista standardi savi- ja orgaanisen aineen pitoisuuksiin, jolloin haitta-ainepitoisuuksia voidaan verrata annettuihin raja-arvoihin.

Haitalliset aineet ovat sitoutuneet saveen ja orgaaniseen ainekseen, jolloin sen normalisoinnilla varmistetaan näytteiden vertailukelpoisuus. Normalisointi on rutiinitoimenpide ruoppaus- ja läjitysmassojen analysoinnissa. Sedimenttinäytteiden tulokset luokiteltiin Sedimenttien ruoppaus- ja läjitysohjeen (YM, 2015) mukaisesti viiteen luokkaan (Kuva).

Kuva 2. Sedimenttien haitta-aineille annettujen ohjeellisten pitoisuustasojen merkitys meriläjituskelpoisuuden arvioinnissa. Ruoppaus- ja läjitysohjeen mukaisesti (YM 2015).

Taulukko 3. Erillisnäytteiden normalisoimattomat tulokset.

Kokoomanäytteiden perusteella alueella esiintyy ruoppaus- ja läjitysohjeessa esitettyjen raja-arvojen ylittäviä pitoisuuksia ainoastaan ylimmän 0–30 cm kerroksen dioksiini ja furaanipitoisuuksissa. Kohonneita dioksiini- ja furaanipitoisuuksia esiintyy yleisesti koko Perämeren alueella. Pitoisuudet olivat tasolla 1B, mikä mahdollistaa massojen läjityksen mereen.

Muuten kaikki analysoidut pitoisuudet jäivät tasolle 1 tai 1A. 60–100 cm kokoomanäytteen normalisoitu kuparipitoisuus oli 37 mg/kg kiintoainetta ja ylitti siten juuri pitoisuustason 1A (raja-arvo 35 mg/kg), mutta ohjeen mukaisesti kyseisellä pitoisuudella ei ole vaikutuksia läjityskelpoisuuteen.

Irtotiheyden perusteella massat eivät ole myöskään eroosioherkkiä, minkä puolesta ne voidaan läjittää mereen. Liitteessä 3 on esitetty kokoomanäytteistä määritetyt raekokojakaumat.

Liite 1. Taulukko 4. Kokoomanäytteiden normalisoidut tulokset.

General Comments

When no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component.

This certificate represents the original certificate and may not be modified or reproduced other than in full, except with the prior written approval of the issuing lab. The results apply only to the material that has been identified, received, and tested. The laboratory has no responsibility for information in this certificate that has been provided by the customer, or results that may be affected by such information. Regarding the laboratory's liability in relation to assignment, please refer to our website <http://www.alsglobal.fi>

Workorder Comments

Sample(s) HL2403973/012, method S-SMLGMS02 - LOR for particular sample(s) raised due to matrix interference.

Sample for the method S-TOC1-IR is dried at 105 °C and pulverized prior to analysis.

Korvaava analyysitodistus 1. Muutos: näyttenimet korjattu asiakkaan pyynnön mukaisesti.

Attachment number 1 is an integral part of the certificate of analysis.

Brief Method Summaries

Analytical Methods	Method Descriptions
S-GC-46	Determination of Organic Tin Compounds (OTC) in sludge and sediment by GC-ICP-MS according to SE-SOP-0036 (SS-EN ISO 23161:2018).
TS-105	Determination of dry weight (DW) according to SS-EN 15934:2012 ed 1.
S-11F-DENS	CZ_SOP_D06_07_120 (CSN EN ISO 17892-4; CSN EN 933-1; CSN EN 933-2; BS ISO 11277; pokyn TOM 23/1) Determination of graininess by the combined method of the suspension density, sieve analyses and calculation of permeability from measured values according to USBSC
*S-DENS-CC	Håkanson, L. & M. Jansson, 1983. Principles of Lake Sedimentology. Springer-Verlag. 313 p.
S-DRY-GRCI	CZ_SOP_D06_01_045 (CSN ISO 11465, CSN EN 12880, CSN EN 14346:2007), CZ_SOP_D06_07_046 (CSN ISO 11465, CSN EN 12880, CSN EN 14346:2007, CSN 46 5735) Determination of dry matter by gravimetry and determination of moisture by calculation from measured values.
S-LI550GR	CZ_SOP_D06_07_047.A (CSN EN 15935, CSN EN 13039, CSN 72 0103, CSN 46 5735) Determination of ash by gravimetry and calculation of loss on ignition from measured values.
S-NTOT-PHO	CZ_SOP_D06_07_102 (CSN ISO 11261) Determination of total nitrogen by modified Kjeldahl method by spectrophotometry.
S-TOC1-IR	CZ_SOP_D06_07_117 (Elementar Company methodology, CSN ISO 10694, CSN EN 13137:2002, CSN EN 15936) Determination of total carbon (TC), total organic carbon (TOC) by the combustion method with IR detection and calculation of total inorganic carbon (TIC), carbonates and organic matter from measured values.
S-DRY-GRCI	CZ_SOP_D06_01_045 (CSN ISO 11465, CSN EN 12880, CSN EN 14346:2007), CZ_SOP_D06_07_046 (CSN ISO 11465, CSN EN 12880, CSN EN 14346:2007, CSN 46 5735) Determination of dry matter by gravimetry and determination of moisture by calculation from measured values.
S-HG-AFSAC	CZ_SOP_D06_02_096 (CSN EN ISO 17852, ISO 16772:2004) - Determination of Mercury by Fluorescence Spectrometry. Sample was homogenized and mineralized by nitric acid in autoclave under high pressure and temperature prior to analysis.
S-METAXAC1	CZ_SOP_D06_02_001 (US EPA Method 200.7, CSN EN ISO 11885, US EPA Method 6010, SM 3120) - Determination of elements by atomic emission spectrometry with inductively coupled plasma and stoichiometric calculations of compounds concentration from measured values. Sample was homogenized and mineralized by nitric acid in autoclave under high pressure and temperature prior to analysis.
S-METAXAC2	CZ_SOP_D06_02_001 (US EPA Method 200.7, CSN EN ISO 11885, US EPA Method 6010, SM 3120) - Determination of elements by atomic emission spectrometry with inductively coupled plasma and stoichiometric calculations of compounds concentration from measured values. Sample was homogenized and mineralized by nitric acid in autoclave under high pressure and temperature prior to analysis.
S-PAHGMS05	CZ_SOP_D06_03_161 (US EPA Method 8270D; US EPA Method 8082A; ČSN EN 17503; ISO 18287; ISO 18475; ČSN EN 17322). Determination of semi volatile organic compounds by gas chromatography method with MS or MS/MS detection and calculation of semi volatile organic compounds sums from measured values
S-SMLGMS02	CZ_SOP_D06_03_181 (US EPA Method 429, US EPA Method 1668, US EPA Method 3550) Determination of semi volatile organic compounds by using gas chromatography method with MS detection and calculation of semi-volatile organic compounds sums from measured values
S-TPHFID05	CZ_SOP_D06_03_150 (ČSN EN 14039; ČSN EN ISO 16703; ČSN P CEN ISO/TS 16558-2; US EPA Method 8015; US EPA Method 3550) Determination of extractable substances in the range of hydrocarbons C10 – C40, their fractions by calculation from measured values using the gas chromatography method with FID detection
S-DFHMS03	CZ_SOP_D06_06_175 (US EPA Method 1613B, CSN EN 16190): Determination of tetra- to octa-chlorinated dioxins and furanes by isotope dilution method using HRGC-HRMS or HRGC-MS/MS and calculation of TEQ parameters from measured value. The samples were stored in laboratory in the darkness and under temperature <4°C. Actual LOQ are noticed in the annex.
S-PCBHMS02	CZ_SOP_D06_06_173 (US EPA Method 1668A, CSN EN 16190): Determination of polychlorinated biphenyls by isotope dilution method using HRGC-HRMS or HRGC-MS/MS and calculation of PCB sums and TEQ parameter from measured values. The samples were stored in laboratory in the darkness and under temperature <4°C. Actual LOQ are noticed in the annex.
S-PCBHMS04	CZ_SOP_D06_06_173 (US EPA Method 1668A, CSN EN 16190): Determination of polychlorinated biphenyls by isotope dilution method using HRGC-HRMS or HRGC-MS/MS and calculation of PCB sums and TEQ parameter from measured values. The samples were stored in laboratory in the darkness and under temperature <4°C. Actual LOQ are noticed in the annex.

Preparation Methods	Method Descriptions
S-P46	Prep method- OTC according to SE-SOP-0036 (SS-EN ISO 23161:2018).
*S-PPHOM.07	CZ_SOP_D06_07_P01 Preparation of solid samples for analysis (crushing, milling and pulverizing).
*S-PPHOM0.3	CZ_SOP_D06_07_P01 Preparation of solid samples for analysis (crushing, milling and pulverizing).

Preparation Methods	Method Descriptions
*S-PPHOM4	CZ_SOP_D06_07_P01 Preparation of solid samples for analysis (crushing, milling and pulverizing).
*S-PPHOM4_10	Preparation of solid samples for analysis (crushing).
*S-PPHOM0.3	CZ_SOP_D06_07_P01 Preparation of solid samples for analysis (crushing, milling and pulverizing).
*S-PPLYOF	Lyofilization of sample

Key: **LOR** = Limit of reporting represents the standard LOR for the respective parameters in each method. Note that limits of reporting may be affected if, e.g. additional dilution was required because of matrix effects, or the sample quantity was limited.

MU = Measurement Uncertainty

* = Symbol preceding any result indicates laboratory or subcontractor non-accredited test.

Measurement Uncertainty:

The uncertainty is given as extended uncertainty (according to the definition in "Guide to the Expression of Measurement", JCGM 100:2008 Corrected version 2010) calculated with a coverage factor of 2, which give level of approximately 95%. Measurement of uncertainty is reported only for detected substances with levels above the reporting limits.

The uncertainty from subcontractors is often given as extended uncertainty calculated with a coverage factor of 2. Contact the laboratory for further information.
